

## Practical 11: Compare AI vs Human Writing

### Aim

To compare AI-generated content with student-created content.

### Objectives

- To identify difference in writing
- To understand AI limitations

### Materials Required

- AI tool

### Procedure

1. Write paragraph manually – Compose a paragraph yourself using your own ideas, wording, and structure on the selected topic.
2. Generate same topic using AI – Use an AI tool to produce another paragraph on the same topic for comparison.
3. Create comparison table – Organize both paragraphs side-by-side in a table to compare style, clarity, tone, and content differences.

## **Ai Generated content:**

In fields like medicine and law, AI is already becoming a "**co-pilot**" that handles diagnostic scanning or document review, which changes the daily responsibilities of professionals rather than removing the professional entirely. Furthermore, the AI revolution is birthing entirely new industries and roles, from AI ethics compliance officers to prompt engineers. The true challenge lies not in the disappearance of work, but in the speed of the transition. Success in this new machine-human economy will depend on a commitment to **lifelong learning** and the ability to leverage AI as a sophisticated tool to enhance, rather than replace, human potential. 

The debate over whether Artificial Intelligence will replace or transform the workforce is central to the modern industrial era. While fears of mass unemployment are common, evidence suggests that AI acts more as a catalyst for **evolution** than a total substitute for human labor. AI excels at automating repetitive, high-volume, and data-intensive tasks—such as basic data entry, routine scheduling, and assembly line processes. However, this shift primarily serves to **liberate human workers** from mundane activities, allowing them to focus on uniquely human strengths: complex problem-solving, strategic thinking, and emotional intelligence.  

## Human Written Content:

Q → "Will AI change Jobs or replace them?"

Artificial Intelligence is the most recent and advance invention that focuses on creating machines or software capable of performing tasks that normally require human intelligence.

AI is changing the whole world slowly and a large shift towards AI is seen in recent time.

Yes according to me the synchronisation of human and artificial intelligence is likely to change the old ongoing way of jobs according to me the world in coming years is going to be very advanced and fast with AI. Some jobs are replaceable but very minimum because there are many places where AI lacks in. Replacement of jobs would not be that easy but the way could be changed easily.
